Hold Payment — Deposit Invoice Flow

Overview

When a customer pays a security deposit via credit card hold (pre-authorization), the system creates a hold payment in **processing** state instead of posting a real payment. The deposit invoice remains outstanding until the hold is either forfeited (No Show) or released (customer returns).

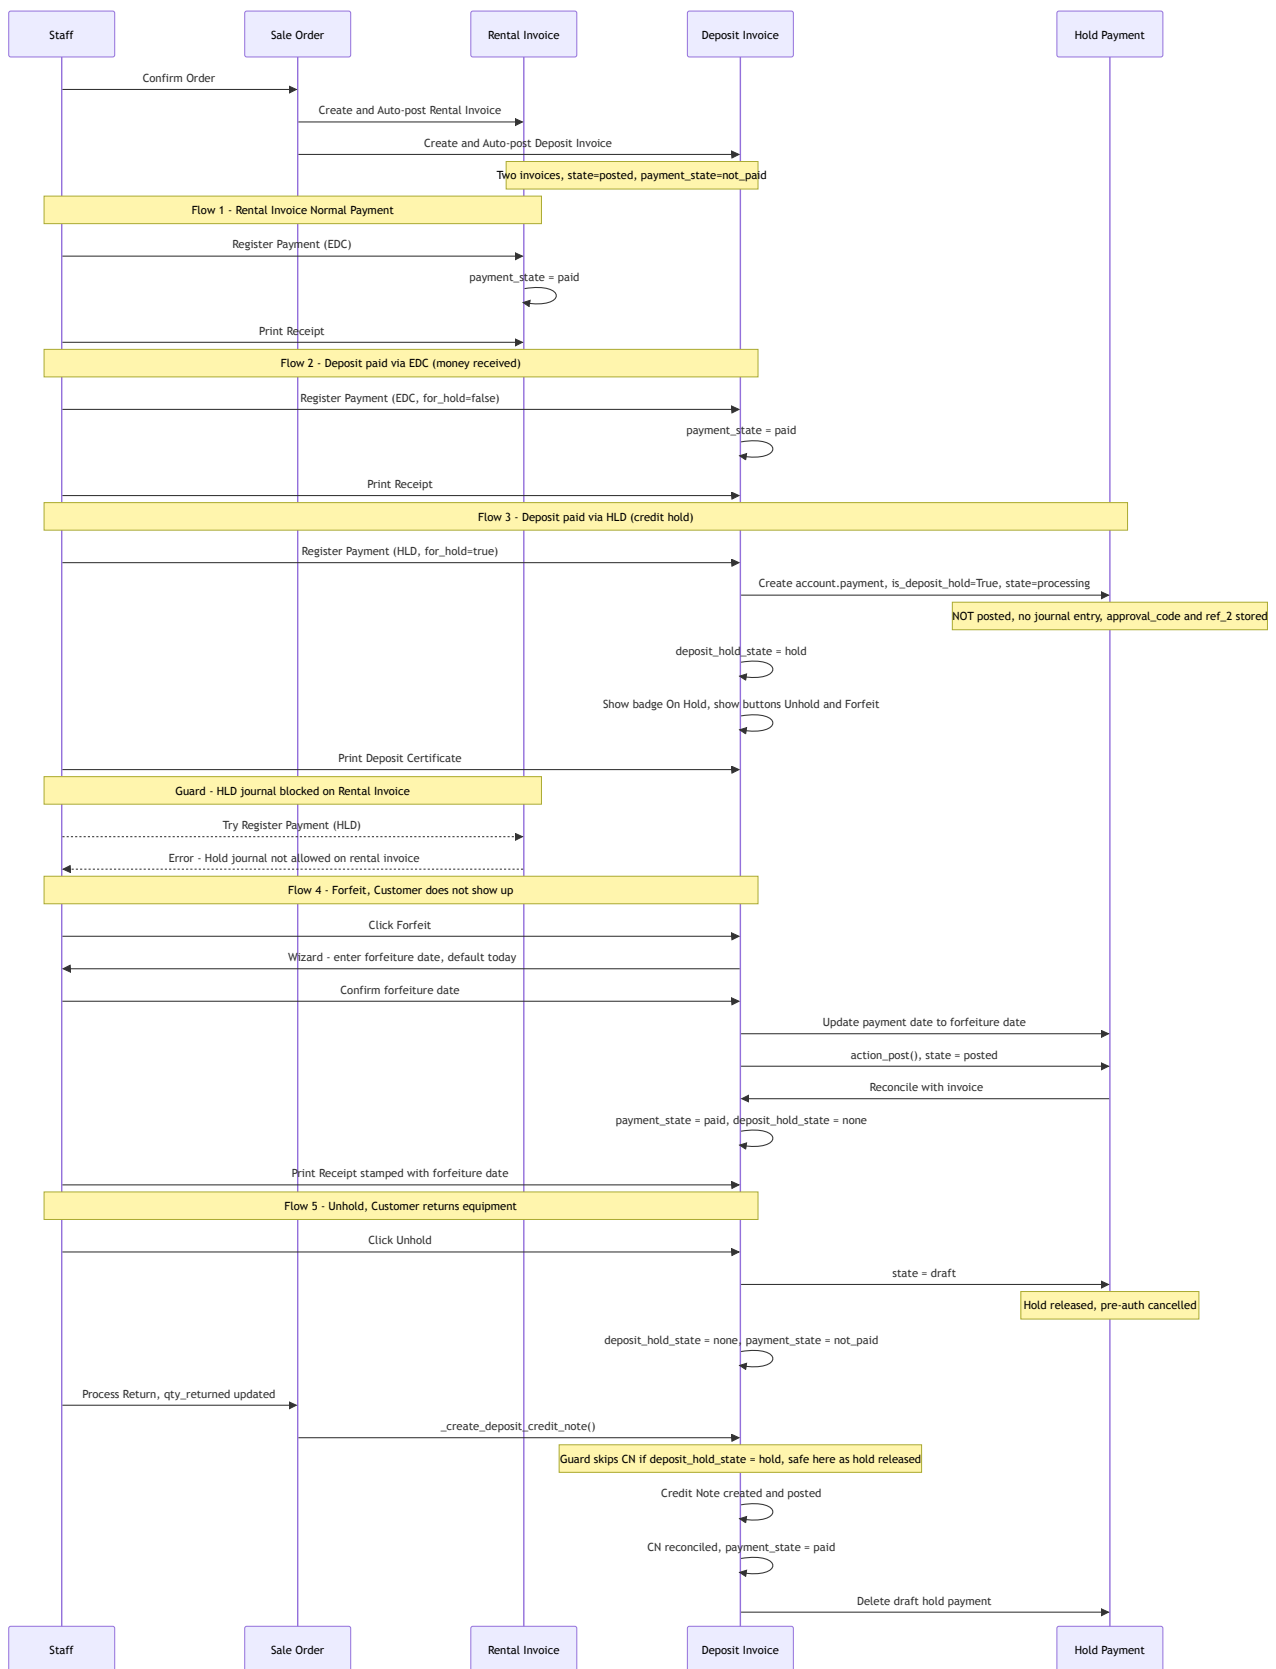

Journals

Journal	for_hold	Allowed on Rental Invoice	Allowed on Deposit Invoice
EDC	False	Yes	Yes → paid immediately
HLD	True	No (blocked)	Yes → hold state

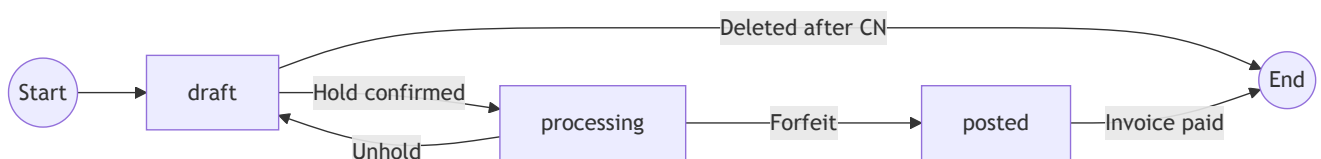

Document Types

Scenario	Document Printed
Deposit paid via EDC (money received)	ใบเสร็จ (Receipt)
Deposit paid via HLD (credit hold)	ใบมัดจำ (Deposit Certificate)
Deposit forfeited (No Show)	ใบเสร็จ (Receipt) stamped with forfeiture date

Sequence Diagram

Payment State Transitions

Key Fields

Model	Field	Purpose
account.journal	for_hold (Boolean)	Marks journal as credit hold type
account.payment	is_deposit_hold (Boolean)	Marks payment as a hold (not a real receipt)
account.payment	state = 'processing'	Custom state: hold active, not yet posted
account.move	deposit_hold_state (Computed)	'none' or 'hold' — drives UI buttons and badge

Guards

Guard	Location	Condition
Block HLD on rental invoice	account.move.action_register_payment	journal.for_hold=True and invoice is deposit
Block normal post of processing payment	account.payment.action_post	is_deposit_hold=True and not called from forfeit flow
Skip CN creation during active hold	sale_order_line._create_deposit_credit_note	deposit_invoice.deposit_hold_state == 'hold'
